

Bentorub® +

Hydrophilic bentonite strip for the sealing of construction joints in concrete.

• field of application

- Bentorub®+ is designed for sealing construction joints, cold joints and working joints in concrete, around pipe penetrations, in sewer joints, against slurry walls, sheet piling, etc.
- Can be used in combination with Infiltra Stop in situations, which are deemed to be high risk.

• advantages

- Bentorub®+ is a permanently active system, which swells up to approximately 400% of its original dry volume^(*).
- Bentorub®+ is an ecological and user friendly system: simple and quick to install by means of gun nailing or glueing. The use of Bentosteel will help the installation and will protect the Bentorub®+ strip against damage during pouring or compaction of the concrete.
- The composition of Bentorub®+ prevents premature swelling.
- Bentorub®+ has a proven track record in water treatment plants, water purification plants, underground parking lots, water reservoirs, swimming pools, water tanks, metro works and other concrete structures subject to high water pressure.
- Bentorub®+ can resist hydrostatic pressures of up to 80 metres of water column = 8 bar.
- The durability and performance of the Bentorub®+ will exceed the design life of the structure (bentonite is a product of nature).
- The highly elastic and plastic properties of Bentorub®+ will easily counter-balance the initial concrete shrinkage of the structure.
- Bentorub®+ can fill small honeycombs.
- Bentorub®+ will not dissolve in water and is non-polluting.

• description

- Bentorub®+ is a green flexible hydrophilic strip of approx. 25 by 20 mm, made of natural sodium bentonite clay and synthetic rubber.
- It comes in lengths of approx. 5 metres.
- Due to the shrinkage of the drying concrete, small cracks and voids will appear in the construction and cold joints, through which water can penetrate.
- In contact with water, Bentorub®+ will swell to approximately 400% of its original volume^(*). The expansive clay mass will thus seal these hair line cracks and voids in the joint.
- The first expansion is retarded to prevent the strip from reacting too soon with possible rainwater, before or during the installation.

• **application**

- Bentorub[®]+ is preferably applied onto a smooth and dust-free concrete surface. Bentorub[®]+ can be used under most weather conditions.
- Installation during heavy rain or in prolonged contact with water can result in a premature swelling of the strip, which should be avoided.
- No special precautions should be taken during the preparatory activities (installation of the reinforcement bars, placement of shuttering, etc) in view of the subsequent installation of bentonite strip.
- The Bentorub[®]+ is applied during the installation of the 2nd phase reinforcement bars, in between inner and outer rows of reinforcing bars.

Procedure for the installation of Bentorub[®]+

Step 1

- Remove dust, dirt and loose parts by brushing firmly.

Application by means of gluing with Bentoglu (horizontal and horizontal hanging applications)

Step 2

- Apply Bentoglu to the surface exerting pressure while caulking in order to obtain a good contact with the surface. Apply a bead of approx. 5x10 mm.

Step 3

- Unroll the Bentorub[®]+ strip and press firmly into the glue. Wait until the glue is dry before pouring concrete (a concrete cover of 7 cm at all sides should always be respected). The roll ends should have a lateral overlapping of 5 to 10 cm. The ends need to be pressed firmly together.

Application by means of gun nailing with or without Bentosteel

Step 2

- Level uneven and irregular surfaces with Bentostic or Swellseal Mastic.

Step 3

- Unroll the Bentorub[®]+ strip (a concrete cover of 7 cm at all sides should always be respected). The roll ends should have a lateral overlapping of 5 to 10 cm. The ends need to be pressed firmly together.

Step 4

- In case of application with the Bentosteel wire mesh (preferred), install the Bentosteel wire mesh over the Bentorub[®]+ strip. Gun nailing without Bentosteel is only possible in horizontal applications, in vertical or hanging applications the use of Bentosteel is required.

Step 5

- Fix the system by nailing or gun nailing (use nails with washer, approx. 4 per metre).
- Bentorub[®]+ can be fixed around pipe penetrations with steel wire or Bentoglu.

• **technical data/properties**

Property	Value	Norm
Swelling capacity in contact with water	Swells approx. 400% of its original dry volume ^(*) .	Test report KUL University
Density	Approx. 1,44 kg/dm ³	ASTM D71-84
Weight	Approx. 0,72 kg/m	Test DNC
Cone penetration	35,5	ASTM D217
Expansion pressure under complete enclosure	≥ 0,70 N/mm ²	Test report KUL University
Resistance against hydrostatic pressure	Up to 80 m water column = 8 bars	Test report DNC
Elongation at rupture	7500%	Test method KUL University
Maximum bend allowed	No cracks at 180° above 0°C	Test method KUL University
Installation temperatures	-15°C to 60°C	Test DNC
Operating temperatures	-45°C to 120°C	Test DNC
Odour	Odourless	

	<ul style="list-style-type: none"> • The swelling properties are created by the particle structure of the clay. • Bentorub[®]+ can only function properly in a confined space in order to develop sufficient expansion pressure and assure waterproofing. • The expansion of Bentorub[®]+ will create a certain pressure, which needs to be counteracted by at least 7 cm of concrete coverage at both sides (installation in the middle of the joint is preferred). • The durability and performance of the Bentorub[®]+ system are superior to the life expectancy of the construction, since it is composed out of inert rubber and clay, a natural product aged millions of years. • For special applications, such as contact with strongly polluted water or chemicals, it is recommended to consult the De Neef representative. For contact with salt water, use Bentorub[®] Salt.
• appearance	Green, rectangular plastic strip of approx. 20 by 25 mm, in rolls of approx. 5 metres length.
• consumption	The necessary quantities depend on the length of the various (construction) joints, which need to be sealed. It has to be taken into consideration that a lateral overlapping of 5 to 10 cm between 2 lengths of Bentorub [®] + is necessary.
• packaging	Cardboard boxes containing 30 metres of strip: 6 rolls of approx. 5 m length. Weight per cardboard box: approx. 21,6 kg net/approx. 23 kg gross. A full pallet contains 24 cardboard boxes of 30 m = 720 m.
• storage	Bentorub [®] + should be stored under cover, clear of the ground. Protect the materials from all sources of moisture and frost. Storage temperature must be between 5°C and 30°C. Shelf life is unlimited.
• certificates/approvals	Socotec - France.
• accessories	<p><u>To be ordered separately</u></p> <p><i>Bentosteel</i></p> <ul style="list-style-type: none"> • Steel wire mesh profile for Bentorub[®]+ • Mesh grid: 10,6 by 10,6 mm. Section: 25,5 mm by 9 mm. • Length: 1 metre. • Packaging: 30 x 1 metre. <p><i>Bentostic</i></p> <ul style="list-style-type: none"> • Mastic for levelling the surface. • Green colour. • Packaging: plastic pails 5 kg.
• health & safety	For full information consult the relevant Material Safety Data Sheet. (*) Tested under laboratory conditions.
